Thank you for the reply, Bruce.

the only problem is – it is one of the Administrators who is logging in in Web Access.

apparently, he gets notified when someone logs in using his username and password– and i wanted to get notified also.

The other problem, regarding my password – he can log into any user's account – as the administrator, so changing my password, won't work !!

I thought it is possible to create an event log or something to know when he/ anyone else logs in on my account. if anyone can help me with this issue – please !!!!

Since this is obviously happening at your work place, you should know that there is no privacy in email there. Your employer can read any of your emails and you shouldn't be sending anything private. It is the employer's network and the employer's computers, not yours.

If you are having personal difficulties with one of the system administrators, then talk to your boss or take it up with your Human Resources Dept. This is not a technical problem and you are not going to be able to solve it with technology.
