It is normal to see these "null sessions" on a Windows computer. They can be used for primarily networking functions such as maintenance of the browse list that you see when you open My Network Places. However they could also indicate that a user has unauthenticated access to a share on your computer. In XP Home that is unavoidable since XP Home can only use simple file sharing. If you do not want to offer shares on an XP Home computer then disable file and print sharing on it. If you do want to offer shares then make sure that you only share folders that you want anyone to be able to access and of course use a firewall to protect your network.

For XP Pro computers to make sure that unauthenticated access can not be made to network shares be sure to disable simple file sharing in Windows Explorer/tools/folder options – view and uncheck the last option for use simple file sharing. Also in XP Pro if you do not want to allow unauthenticated access make sure the guest account is disabled because if it is enabled then unauthenticated access could be allowed to shares that include everyone for share and folder/NTFS permissions. The command net user guest to quickly check the status of the guest account. Another thing I do on my computers for XP Pro is to open Local Security Policy via secpol.msc and go to local policies/user rights and find the user right for access this computer from the network. I remove everyone and users and add authenticated users. That will prevent unauthenticated access to a share even if the guest account becomes enabled.
