I don't know exactly how you did it but this should work. Create [even if just temporarily] another user account that is also an administrator and use this account to copy the profile from the built in administrator account to the other user account that is also an administrator that you want to use. Then go to Control Panel/system and then select advanced/user profiles – settings. Then select copy to select the profile you want to copy and select copy to. Browse to the profile folder you want to copy to under documents and settings. Select the folder with the user name and select OK. Under permitted to use select the user name that is going to use that profile. Then select OK and it should copy everything over to the new user profile selected.

Steven:

I don't know if you would be willing, but I have a question posted in the Configuration and Management section that no one has answered. If you would consider giving me some help on this issue, it would be appreciated. If you don't, that's fine, just say so. Here goes:

I have decided to create a new user profile (with administrator rights) and not use the default (Administrator) user profile, as a precaution to not mess up my good Administrator profile.

So....I copied the profile from the "Administrator" to the new user account that has administrator rights. It copied just fine. When I logged in under the new profile, I was expecting everything to look the same, and

Re: "Classic logon" screen in XP does not remember the user name

that
the installed programs would work, etc. As it turns out, only about 1/2
of
the icons transferred over, and many of the installed programs like
Microsoft
Office, etc, are not installed in the new profile, although some of the
icons
show up.

Any thoughts on how I could do this again? The copy took about 15
minutes,
but it did finish with no reported errors. Maybe what I am trying to
accomplish can't be done?

Thanks for any help that you can give.

Hi Steven:

Thanks for your reply. Usually I get automatic notification of your
responses, and this time I did not, so I am sorry that there has been a
few
days lapse here. I probably forgot to mark the "Notify me of replies"
box
last time.

I checked the setting you mentioned, and it does not appear that is the
problem, as there was no check in that box at all. When I am at the
server,
and log onto a workstation, that workstation immediately goes to a locked
login screen. During that time, you can work from the server and access
that
workstation, but you cannot have a person on the server and a person on
the
workstation at the same time. I assumed that you could have concurrent
usage
like you can in PCAnywhere, but it does not appear to be the case with
Remote
Desktop. So perhaps, there is no problem at all, but just the way it is
designed to work.

Thanks again for your help.

The screensaver is probably configured to lock the computer after a period of idle time as a security measure if a user did not manually lock the computer using Control-Alt-Delete - lock computer. Try going to Control Panel/display - screen saver and uncheck "on resume password protect".

Steven:

Once again, your suggestions worked just fine. Thanks.

As a follow up, after I logged onto the workstation from the server, and then logged off, I went to the workstation. There was a message on it that the workstation was locked and could only be unlocked by the administrator. This message however, does not show up on the server when I log onto the server from my home. So there must be a setting that I could change so my workstation does not "lock".

Again, any help you could give would be most appreciated.

Hi John.

To access a computer via RDP you need the user right for allow logon through Terminal Services on the computer you are trying to access. Try adding your user account to the Remote Desktop Users group which should show as being included for the user right for allow logon through terminal services. You could also try adding your user account to that user right. Note that sever user right have a corresponding "deny" user right and these override an "allow" user right so make sure that there are no users/groups listed in deny logon through Terminal Services that could be causing you to get that message. When you are done configuring Local Security Policy run the command

Hi Steven:

Thank you
very much,
your
suggestion
worked just
fine. In
retrospect,
I
think that I
turned
changed
that feature
myself, and
didn't know
that
would
be the
subsequent
result. I was
trying to
configure a
remote
desktop
connection.
Would you
be willing
to help me
with that,
since you
seem
to
know about
the
"interactive"
features?

If so, here
goes.

Re: "Classic logon" screen in XP does not remember the user name

I have a home computer and connect to my office computer via "Remote Desktop". My office computer is a server, and it manages about 6 workstations. What I was trying to do, was to connect to the office server, and then, activate the "Remote Desktop" on the server, to get to the workstations. I almost made it, as I get to the login screen of the workstation, but when I try to login, it gives me the error,

"Local security policy does not allow interactive login on this

Re: "Classic logon" screen in XP does not remember the user name

machine".

So that is
why I was
working
with the
"interactive"
settings in
the
security
policy,
which I then
turned off
the feature
to retain the
last
used
user
login name.

If you have
any ideas
about how
to get past
my security
policy not
allowing
the
interactive
login, I
would
appreciate
it.

Best regards

I
am
using
Windows
XP
Pro
SP2.
My
workstation
is
part
of
a
local
network
and
the
Administrator
"user
name"
is
password
protected.
I
use
the
classic
view.

Re: "Classic logon" screen in XP does not remember the user name

When
I
boot
my
computer
or
change
users,
it
comes
back
up
with
a
"Log
on
to
Windows"
screen,
asking
for
a
user
name
and
a
password.
In
the
past,
the
user
name
of
"Administrator"
would
be
remembered,
and
all
I
would
have
to
do
is
type
in
the
password,
and

Re: "Classic logon" screen in XP does not remember the user name

continue.
Now,
it
does
not
remember
the
user
name,
and
the
user
name
and
password
fields
are
both
blank.

I
would
like
to
get
back
to
it
retaining
the
user
name
last
used.

The
only
thing
I
have
done
with
my
computer
recently,
is
I
tried
to
set
up
