Jaime Rodríguez <nouser@xxxxxxxxxxxx> wrote:

Hello experts,

In a box with WinXP SP2 with 2 users (single user & admin) in the admin, the other user is only allow to make a telnet connection to a server, so i used gpedit.msc to make all the necessary blocks and settings and only allow user to run this only shorcut in desktop.

When using gpedit.msc i blocked all access to HD, to LAN, to all menus in explorer, desktop, anyway, i did a very hard-to-bypass settings (user can not do ANYTHING), i forgot to make a shorcut for gpedit.msc in my admin user just in case i need to make settings again, and now i can't even access or display menus or anything in my admin user, so the question is.....How can I make my way to run my gpedit.msc in order to make the settings im missing??? i don't want to reinstall windows just because i messed up??

Im sorry if i wasn't clear in my explanation.... any help would be greatly appreciated. Thanks.

JR.

You might want to try the following. You'll need an XP

Re: gpedit.msc

installation CD.

Restart your computer and boot from the CD into the Recovery Console.

To start the computer and use the Recovery Console

http://www.microsoft.com/resources/documentation/windows/xp/all/proddocs/en-us/recovery_run_console.mspx?mfr=

Once you've got the Recovery Console running, use the CD command to navigate to this location.

C:\Windows\System32\GroupPolicy\User

Use the REN command to rename the registry.pol file in that folder to registry.old.

Exit the recovery console.

Hopefully, when your computer restarts you'll have restored access.

Good luck

Nepatsfan
