Meaning, your computer has been joined to a new domain, and had a name change in the meantime.... right?

> however would still like to boot up using my original computer name and domain.

I don't know what that means exactly (especially regarding the computer name....you can have only one). What's the relationship between the two domains?

> Is it possible to maintain two different sets of computer names / domains? Currently, I can log onto my machine using one user id and can map to a location using my other user id on my original domain, however I would like to know if one could switch between these two profiles, to make things easier.

Your computer can belong to only one domain at a time (or workgroup). There are third party products like NetSwitcher & MultiNetworkManager, but I don't use them (and am not sure they're officially supported by MS). What you're doing now is the way I do it ....and I have only one Windows profile to deal with.
