We have undertaken a project to switch all of our users to standard user accounts (no administrative rights on the local machine). We have many users that are setup so that they can access their computers from home. We've noticed that when the user is removed from the Administrators group, the list of authorized remote users (My Computer > Properties > Remote tab > Select Remote Users) gets wiped out. An administrator then has to log on to the machine and add the user back to the list.

I can see why this would happen, but it does present something of a problem for us. I would prefer not to have to manually fix this problem on hundreds of machines. Is there a way that we can retain the list of authorized remote users when we remove the employees administrative rights on the machine? Also, is there some way—perhaps a script—that we can identify the machines were remote users have been setup?
