

Re: Group Policy Editor

– and see whether it helps you identify the locations. Log in as an admin, but launch Process Explorer using runas & specify an admin account – then try to launch the app.

Oh – and don't forget to complain to the product developers about their sloppy code. Users should not need admin rights to run desktop software.

Ok thanks Lanwench! You're right, it's not all apps, just some apps. I'll try what you suggest. And I'm frustrated with the developers because when I go to 'Help and Support' from the start menu, it explains all about the Group Policy editor and how to allow software permissions in user configuration, then surprise, surprise, it's not set up on xp media center.

MCE is odd, indeed.

What a waste of a couple hours fooling around with that. I trusted that the help/support center installed with the OS would refer to my OS; and that's not the case here. If I knew who to complain to I would, it's just that sifting through all the forums, newsgroups, technets is tedious and I can't seem to find the 'complaints department'

Not sure what you searched for in Help & Support – even *outside* of MCE, this would not be a group policy issue. If you google for "limited user" application error <etc> you will find a lot.

You ought to be complaining to the doofuses who wrote the third party applications which your end users cannot run. :-)

.
