To all the Doubting Thomases out there, here are a series of photographs -- taken yesterday (June 21, 2004) -- showing a huge piece of slate removed from between coal veins in Northeastern Pennsylvania's anthracite region.

>

The slate had to be fluidy for the numerous petrified bones to be embedded in it during the Carboniferous Period. It couldn't have happened any other other way.

>

For size comparison, that's a package of Focus 100s cigarettes (the only kind I can afford to buy these days).

<

Man as Old as Coal

>

May I repeat: MAN AS OLD AS COAL

>

=====
