the light would still reach us for perhaps a million more years. It might be easier to remind one of sound. We see the flash of lightning and hear the sound some time later. It is the slowness of sound which makes for the delay in hearing it after seeing the flash. It is the slowness of light which may make possible an instrument for "seeing" the past.

If we could move instantly to a planet so far distant that it took light one year to reach it from the planet which we had just left, we would see light which had started out one year before us. If we had some, as yet imaginary, super-powerful, super-sensitive telescope with which we could focus on any part of the Earth, we would see events on Earth which were a year old. Given the ability to move with our super telescope to a planet so far distant that the light from Earth took one million years to reach it, we should then be able to see Earth as it was one million years ago. By moving further and further, instantly, of course, we should eventually reach a point from which we would be able to see the birth of Earth, or even the sun. The Akashic Record enables us to do just that. By special training we can move into the astral world where Time and Space do not exist and where other "dimensions" take over. Then one sees all. Other Time and Space? Well, as a si
